Experiment No.5
Create HIVE Database and Descriptive analytics-basic statistics.
Date of Performance: 14/08/23
Date of Submission: 21/08/23

Aim: Create HIVE Database and Descriptive analytics-basic statistics.

Theory:

Hive is a database technology that can define databases and tables to analyze structured data. The theme for structured data analysis is to store the data in a tabular manner, and pass queries to analyze it. This chapter explains how to create Hive database. Hive contains a default database named default.

Create Database Statement

Create Database is a statement used to create a database in Hive. A database in Hive is a namespace or a collection of tables. The syntax for this statement is as follows:

CREATE DATABASE|SCHEMA [IF NOT EXISTS] <database name>

Here, IF NOT EXISTS is an optional clause, which notifies the user that a database with the same name already exists. We can use SCHEMA in place of DATABASE in this command. The following query is executed to create a database named userdb:

hive> CREATE DATABASE [IF NOT EXISTS] userdb;

hive> CREATE SCHEMA userdb;

The following query is used to verify a databases list:

hive> SHOW DATABASES;

default userdb

Program :

JDBC program to create a database –

```
import java.sql.SQLException;

Import java.sql.connection;

Import   java.sql.Result;   import
java.sql.Statement;         import
java.sql.DriverManager;

   public class HiveCreateDb {
```

```
private static String driverName = "org.apache.hadoop.hive.jdbc.HiveDriver"; public
static void main(String[] args) throws SQLException {

  // Register driver and create driver instance
  Class.forName(driverName);

  // get connection
  Connection con =
  DriverManager.getConnection("jdbc:hive://localhost:10000/default","", "");

  Statement stmt = con.createStatement(); stmt.executeQuery("CREATE
  DATABASE userdb");

  System.out.println("Database userdb created successfully."); con.close();

}
}
```

Output:

```
hive> SHOW DATABASES;

CONCLUSION:

Hive provides a SQL-like user interface designed specifically for searching large datasets housed in distributed storage systems. It has a significant impact on the fields of data warehousing and analytics inside the Hadoop ecosystem. In this demonstration, we created a Hive database, described the table structure, added data, and performed basic statistical and descriptive analytics on it. Hive's ability to manage massive amounts of data is impressive, and its SQL-like syntax provides usability for users familiar with relational databases. The specific queries and analytics performed depend on the underlying properties of the data and the particular insights desired.
